"The bottlenose dolphin (Tursiops truncatus) population of Laguna de Terminos, Campeche, Mexico: Ecology & Acoustics"

Laguna de Terminos is the largest coastal lagoon in Mexico located at the most southern part of the Gulf of Mexico. This lagoon is a natural reserve and it is next to the Sonda de Campeche, where most of the Mexican oil is extracted, thus being impacted by anthropogenic activities. This lagoon is also home to the largest bottlenose dolphin (Tursiops truncatus) population in Mexican waters. Our research group sampled this lagoon for five years from 2004 to 2008 to related its physical characteristics with the occurrence of bottlenose dolphins. Results of the findings will be presented.
